

A. Mitochondrial biogenesis TFs (PGC-1a axis) - filled = padj<0.1

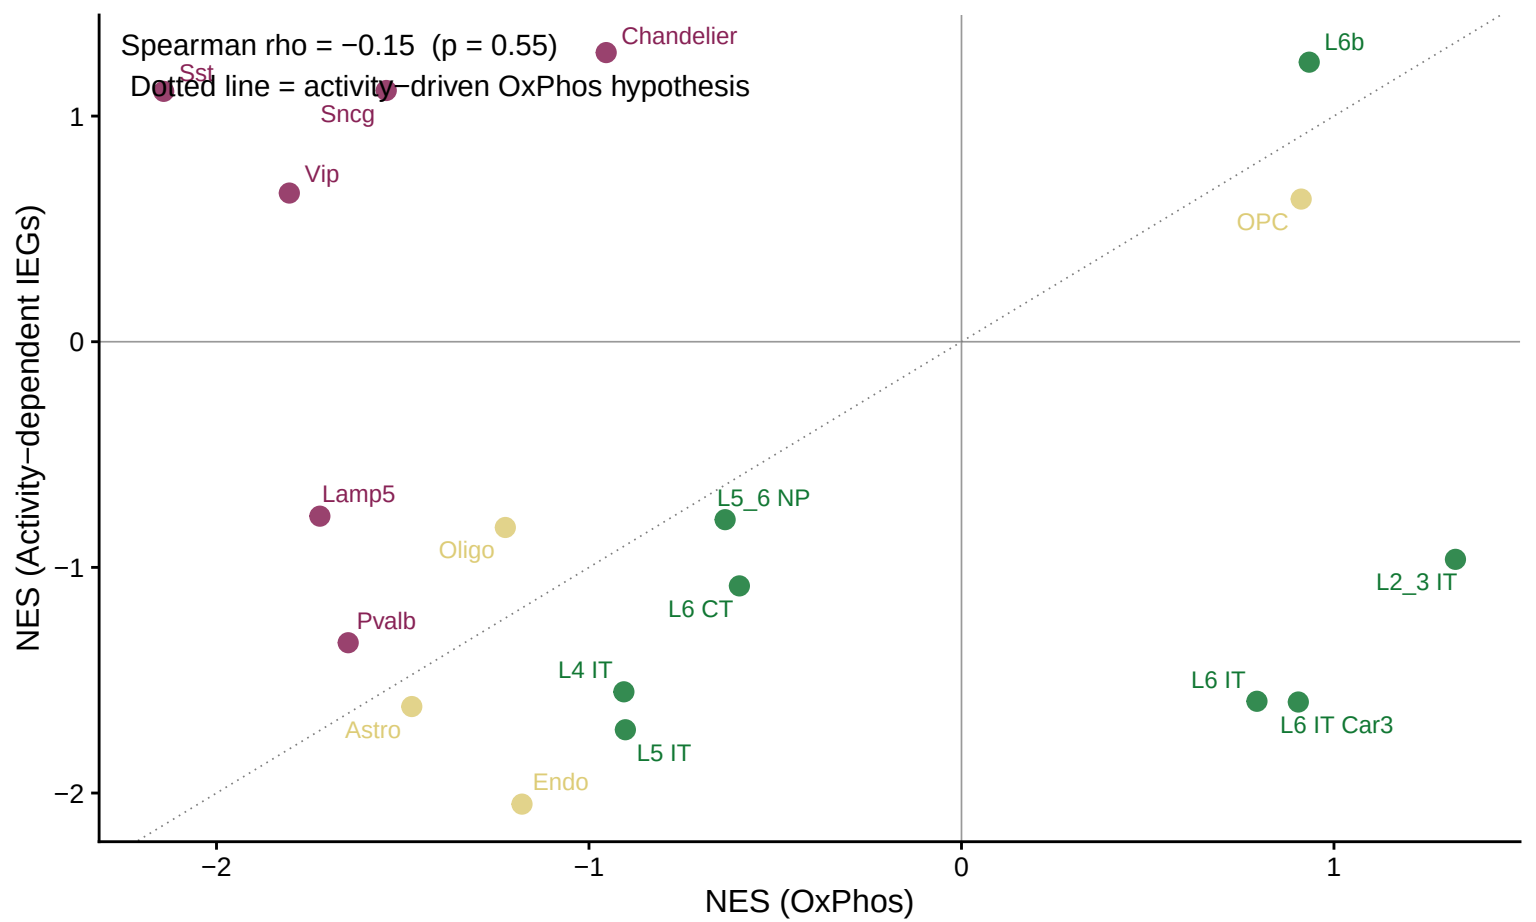

B. Mechanism gene-set GSEA across all cell types - which hypothesis is supported where?

C. Glycolytic compensation? If OxPhos down forces a Warburg switch, we'd expect negative slope.

D. Activity hypothesis: if firing demand drives OxPhos, IEGs should track OxPhos.

E. Activity-dependent IEGs across inhibitory cells (filled = padj<0.1)
